External beam radiotherapy (EBRT) or teletherapy is the most common form of radiotherapy (radiation therapy). The patient sits or lies on a couch and an external source of ionizing radiation is pointed at a particular part of the body. In contrast to brachytherapy (sealed source radiotherapy) and unsealed source radiotherapy, in which the radiation source is inside the body, external beam ...

Radiation therapy uses high-energy radiation from x-rays and other sources to kill cancer cells and shrink tumors. Radiation that comes from a machine outside the body is called external-beam radiation therapy as opposed to radiation that is administered by placing a radiation plaque over or very near the tumor (internal radiation therapy or brachytherapy).

Conventional external beam radiation therapy (2DXRT) is delivered via two-dimensional beams using kilovoltage therapy x-ray units or medical linear accelerators which generate high energy x-rays.
