Classical mechanics describes the motion of macroscopic objects, from projectiles to parts of machinery, and astronomical objects, such as spacecraft, planets, stars and galaxies.. If the present state of an object is known it is possible to predict by the laws of classical mechanics how it will move in the future (determinism) and how it has moved in the past (reversibility).

Inertia is the resistance of any physical object to any change in its position and state of motion.This includes changes to the object's speed, direction, or state of rest.. Inertia is also defined as the tendency of objects to keep moving in a straight line at a constant velocity.
